VOORWOORD.

De getallen der tabellen geven aan den waterstand in het ondiepste gedeelte van het vaarwater, zijnde dit een punt van den buitendrempel, alwaar bij **gemiddelden waterstand 83.0 dm** water staat.

Om de waterbeweging juister te kunnen beoordeelen, zijn de diepten tot in centimeters medegedeeld, hoewel in de praktijk afronding tot decimeters voldoende is.

In de tabellen is hoog- en laagwater respectievelijk aangegeven door groote en kleine vette cijfers.

De gebezigde tijd is **Java-tijd.**

Bij de berekening der waterstanden is de methode van **Dr. J. P. van der Stok** gevolgd (zie Natuurkundig Tijdschrift voor Ned.-Indië Deel LVI, 1896 en „Harmonische Analyse der Watergetijden" van **P. Joh. Smits**), waarbij gebruik gemaakt werd van de door **Dr. H. P. Berlage Jr.** ontworpen en op het Observatorium vervaardigde getijmachine.

De ondervolgende constanten zijn gebezigd, welke afgeleid werden uit uurlijksche aflezingen van de diagrammen van een zelfopteekenende peilschaal op het Djamoean-rif, op 6°55.'7 S. B. en 112°43.'7 E. L. gedurende 46 periodes van 28 dagen, in de jaren 1893 t/m 1907.

	Amplitudo / Amplitude	g.
S_2	8 cm.	11°
M_2	4 „	30°
K_1	54 „	325°
O_1	26 „	266°
P_1	15 „	326°
N_2	2 „	58°
K_2	2 „	352°

Met nadruk moet er op gewezen worden, dat de standen, berekend volgens de opgegeven getij-constanten, wel de werkelijke waterbeweging in hoofdzaak weergeven, maar dat de ervaring heeft geleerd, hoe afwijkingen kunnen optreden, waarbij verschillende oorzaken in het spel treden, die zeer moeilijk of niet te voorspellen zijn.

PREFACE.

These tide-tables contain the figures of the waterlevel in the shallowest part of the channel, this being a point of the outer bar, where the **mean depth is 83.0 dm.**

To obtain a better insight into the motion of the water, the depths are given in centimetres, although in practice it is sufficient to round off in dm.

In the tables high and low tides are printed in large and small bold types respectively.

The time used is **Java-time.**

For the calculation of the tides the method of **Dr. J. P. van der Stok** is used (see Natuurkundig Tijdschrift voor Ned.-Indië Deel LVI, 1896 and "Harmonische Analyse der Watergetijden" of **P. Joh. Smits**). The computation of the tables has been executed with the aid of the tidepredicting machine, projected by **Dr. H. P. Berlage Jr.** and constructed at the Observatory.

The following constants are used, which have been deduced from hourly readings of the diagrams of a selfregistering tide-gauge on the Djamoean-riff at 6°55.'7 S. Lat. and 112°43.'7 E. Long. from Greenwich during 46 periods of 28 days in the years 1893 up to and incl. 1907.

It is pointed out emphatically, that the figures calculated with the given tide-constants represent the principal motion of the water, but experience has shown, that deviations may occur, due to different causes, which can hardly or not be forecasted.

Hieronder zijn te noemen: de invloed van doorstaande winden en toevallige versterking van anders te verwaarloozen neven- en samengestelde getijden.

Eventueele verlating of vervroeging van de getijgolf kan bij snel verval groote verschillen tusschen de werkelijke en berekende waterstanden brengen.

Among these factors are to be mentioned the influence of prevailing winds, and accidental strengthening of partial or compound tides, commonly to be neglected.

Eventual delay or acceleration of a tidewave may cause large differences between the observed and calculated heights, when the tide is changing rapidly.

HERLEIDING VAN DECIMETERS IN ENGELSCHE VOETEN.
CONVERSION OF DECIMETRES INTO ENGLISH FEET.
