VOORWOORD.

De getallen in de tabellen geven aan den waterstand in het ondiepste gedeelte van het vaarwater, zijnde dit een punt van den buitendrempel, alwaar bij **gemiddelden waterstand 48.0 dm.** water staat.

Hoog- en laagwater vallen bij Soensang $^3/_4$ uur later dan op den buitendrempel.

Om de waterbeweging juister te kunnen beoordeelen, zijn de diepten tot in centimeters medegedeeld, hoewel in de praktijk afronding tot decimeters voldoende is

In de tabellen is hoog- en laagwater respectievelijk aangegeven door groote en kleine vette cijfers.

De gebezigde tijd is **Z. Sumatra-tijd.**

Bij de berekening der waterstanden is de methode van **Dr. J. P. van der Stok** gevolgd (zie Natuurkundig Tijdschrift voor Ned.-Indië Deel LVI, 1896 en „Harmonische Analyse der Watergetijden" van **P. Joh. Smits)**, waarbij gebruik gemaakt werd van de door **Dr. H. P. Berlage Jr.** ontworpen en op het Observatorium vervaardigde getijmachine.

De ondervolgende constanten zijn gebezigd, welke door interpolatie zijn afgeleid uit voor de plaats van het loodslichtschip en voor Soensang bekende getijconstanten.

S_2	Amplitudo / Amplitude	13	cm.
M_2	,,	27	,,
K_1	,,	88	,,
O_1	,,	60	,,
P_1	,,	23	,,
N_2	,,	5	,,
K_2	,,	4	,,

Met nadruk dient er op gewezen te worden, dat de standen, berekend volgens de opgegeven getij-constanten, wel de werkelijke waterbeweging in hoofdzaak weergeven, maar dat de ervaring heeft geleerd, hoe in monden als die van de Palembangrivier, afwijkingen kunnen optreden, waarbij verschillende oorzaken in het spel treden, die zeer moeilijk of niet te voorspellen zijn.

PREFACE.

These tables contain the figures of the waterlevel in the shallowest part of the channel, this being a point of the outer bar, where the **mean depth is 48.0 dm.**

At Soengsang high-and low tide occur $^3/_4$ h later than on the outer-bar.

To obtain better insight into the motion of the water, the depths are given in centimetres, although in practice it is sufficient to round off in decimetres.

In the tables high-and low tides are printed in large and small bold types.

The time used is **S. Sumatra-time.**

For the calculation of the tides the method of **Dr. J. P. van der Stok** is used (see Natuurkundig Tijdschrift voor Ned.-Indië Deel LVI, 1896 and „Harmonische Analyse der Watergetijden" of **P. Joh. Smits)**. The computation of the tables has been excecuted by means of the tidepredicting machine, projected by **Dr. H. P. Berlage Jr.** and constructed at the Observatory.

The following constants which were found by interpolation from the known tide-constanst for the place of the pilot. lightship and for Soensang have been used.

Kappagetal / Kappa-number		233°
,,		198°
,,		156°
,,		93°
,,		154°
,,		168°
,,		268°

It is pointed out emphatically that the figures calculated with the given tide-constants represent the principal motion of the water, but experience has shown, that in river mouths as the one of the Palembangriver deviations may occur due to different causes, which can hardly or not be forecasted.

PERPUSTAKAAN NASIONAL

Hieronder zijn te noemen de invloed van doorstaande winden, verhoogde of verminderde waterafvoer van de rivier en toevallige versterking van anders te verwaarloozen neven- en samengestelde getijden.

Eventueele verlating of vervroeging van de getijgolf kan bij snel verval groote verschillen tusschen de werkelijke en berekende waterstanden brengen.

Volgens de, uit de waarnemingsreeks afgeleide, meteorologische getijden, zouden op de gegeven standen nog de volgende correcties kunnen toegepast worden.

Januari	(January)	+ 1.7	dm.	Juli	(July)	— 2.3	dm.
Februari	(February)	+ 2.6	„	Augustus	(August)	— 2.0	„
Maart	(March)	+ 2.5	„	September	(September)	— 1.5	„
April	(April)	+ 1.5	„	October	(October)	— 0.9	„
Mei	(May)	+ 0.3	„	November	(November)	— 0.3	„
Juni	(June)	— 1.7	„	December	(December)	+ 0.7	„

Among these factors are to be mentioned the influence of prevailing winds increasing or decreasing discharge of the river, and accidental strengthening of partial or compound tides, commonly to be neglected.

An eventual retardation or acceleration of a tide-wave may cause large differences between the observed and calculated waterlevel when the tide is changing rapidly.

According to the meteorological tides deduced from the series of observations, the following corrections to the given heights have still to be applied.
