PERPUSTAKAAN NASIONAL REPUBLIK INDONESIA

PERPUSTAKAAN NASIONAL RI.

VOORWOORD.

De getallen der tabellen geven den waterstand aan in het ondiepste gedeelte van het vaarwater, zijnde dit een punt van den buitendrempel (alsook van den binnendrempel) der Moeara Bajor, alwaar bij **gemiddelden waterstand 47.0 dm** water staat.

Voor verschillende gedeelten der Koetei-rivier moeten de volgende correcties worden toegepast:

Optellen bij waterstand volgens de getijtafel ongeveer: Add to the figures of the tide-table about:		Hoogwater valt later (+) dan wel vroeger (—) dan volgens getijtafel ongeveer: High tide later (+) or earlier (—) than in tide-table about:	
			uur / hour
Moe[a] Bajor nabij buiten gasboei / near outer lightbuoy	0 dm	0	
„ „ „ binnen gasboei / inner lightbuoy	0 „	0	
„ „ „ W. ingang kleine kali / W. entrance little river	+ 2 „	+ ¾	„
„ „ „ Kg. Klamboe	+ 2 „	+ ¾	„
„ Bekapai buitenbank / outerbar	— 7 „	— ½	„
„ Djawa „	— 17.5 „	— 1	„
„ „ nabij S. Doendang / near S. Doendang	— 24 „	— ½	„
„ Berau buitendrempel / outerbar	— 16 „	— ¼	„
„ Pegah „	— 10 „	— ¾	„

Om de waterbeweging juister te kunnen beoordeelen, zijn de diepten tot in centimeters medegedeeld, hoewel in de praktijk afronding tot decimeters voldoende is.

In de tabellen is hoog- en laagwater respectievelijk aangegeven door groote en kleine vette cijfers.

De gebezigde tijd is zônetijd **(Javatijd)**.

Bij de berekening der waterstanden is de methode van **Dr. J. P. van der Stok** gevolgd (zie Natuurkundig Tijdschrift voor Ned.-Indië Deel LVI, 1896 en „Harmonische Analyse der Watergetijden" van **P. Joh. Smits)**, waarbij gebruik gemaakt werd van de door **Dr. H. P. Berlage Jr.** ontworpen en aan het Observatorium vervaardigde getijmachine.

De volgende constanten zijn gebezigd, afgeleid uit uurlijksche waarnemingen gedurende twee maanden aan een peilschaal bij de Noordkust van Noebi 0°42 S. B. en 117°30 E. L. van Greenwich.

	Amplitudo / Amplitude	g
S_2	43 cm.	209°
M_2	59 „	154°
K_1	24 „	279°
O_1	15 „	242°
P_1	9 „	279°
N_2	9 „	140°
K_2	13 „	210°

Met nadruk moet er op gewezen worden, dat de standen, berekend volgens de opgegeven getijconstanten, wel de werkelijke waterbeweging in hoofdzaak weergeven, maar dat de ervaring heeft geleerd, hoe in riviermonden, als die van de Koetei-rivier afwijkingen kunnen optreden, waarbij verschillende oorzaken in het spel treden, die zeer moeilijk of niet te voorspellen zijn.

Hieronder zijn te noemen: de invloed van doorstaande winden, verhoogde of verminderde waterafvoer der rivier, toevallige versterking van anders te verwaarloozen neven- en samengestelde getijden.

Eventueele verlating of vervroeging van de getijgolf kan bij snel verval groote verschillen tusschen de werkelijke en berekende waterstanden te weeg brengen.

Volgens de uit een (andere) waarnemingsreeks van een jaar afgeleide meteorologische getijden, zouden behalve op de buitenbanken op de gegeven standen nog de volgende verbeteringen kunnen toegepast worden:

Januari	(January)	+ 1.8 dm.
Februari	(February)	+ 1.7 „
Maart	(March)	+ 1.8 „
April	(April)	+ 1.9 „
Mei	(May)	+ 1.0 „
Juni	(June)	— 0.9 „
Juli	(July)	— 2.8 dm.
Augustus	(August)	— 3.7 „
September	(September)	— 2.8 „
October	(October)	— 0.9 „
November	(November)	+ 1.0 „
December	(December)	+ 1.9 „

PREFACE.

These tables contain the figures of the waterlevel in the shallowest part of the channel, this being a point on the outer bar (also of the innerbar) of the Moeara Bajor where the **mean depth is 47.0 dm.**

For the following parts of the Koetei-river the following corrections have to be applied:

To obtain a better insight into the water motion the depths are given in centimetres, although in practice it is sufficient to round off in decimetres.

In the tables high- and low-tides are printed in large and small bold types respectively.

The time used is standardtime **(Java time)**.

For the calculation of the tides the method of **Dr. J. P. van der Stok** is used (see Natuurkundig Tijdschrift voor Ned.-Indië Deel LVI, 1896 and „Harmonische Analyse der Watergetijden" bij **P. Joh. Smits)**. The computation of the tables has been excecuted by means of the tide predicting machine, projected by **Dr. H. P. Berlage Jr.** and constructed at the Observatory.

The following constants have been used, which are deduced from hourly observations made during two months at a tide-gauge at the Northcoast of Noebi at 0°42 S. Lat. and 117°30 E. Long.

Among these factors are to be mentioned the influence of prevailing winds, increasing or decreasing discharge of the river and accidental strengthening of partial or compound tides commonly to be neglected.

An eventual retardation or acceleration of a tide-wave may cause large differences in the observed and calculated waterlevel when the tide is changing rapidly.

According to the meteorological tides deduced from other series of observations, the following corrections to the given heights have still to be applied, except on the outerbars:
